Faculty of Computer Science

- 1. Name of teacher :** Avinash Singh
Subject Name : Data Base management System
Semester : Fourth Semester
Timings : 10:00 AM to 10.45 AM
Topic : Introduction of Backup and Recovery Process in DBMS and drop command.
No of students Present : 31
- 2. Name of teacher :** Avinash Singh
Subject Name : Digital Electronics
Semester : Second Semester
Timings : 12.00 noon to 12.45 PM
Topic : Introduction and Implementation of Half Adder
No of students Present : 14

A combinational circuit that performs the addition of two bits is called a half adder.

The truth table for the half adder is listed below:

x	y	C	S
0	0	0	0
0	1	0	1
1	0	0	1
1	1	1	0

S: Sum
C: Carry

$S = xy + xy'$
 $C = xy$

Handwritten notes: 2=11, 3=11, 3=11, S = xy + xy', C = xy, and a diagram of a half adder circuit.

16.1 Failure Classification

There are various types of failures that may occur in a system, each of which needs to be dealt with in a different manner. In this chapter, we shall consider only the following types of failures:

- Transaction failure.** There are two types of errors that may cause a transaction to fail.
- Logical error.** The transaction can no longer continue with its normal execution because of some internal condition, such as bad input, data not found, overflow, or resource limit exceeded.
- System error.** The system has entered an undesirable state (for example, deadlock), as a result of which a transaction cannot continue with its normal execution. The transaction, however, can be reexecuted at a later time.
- System crash.** There is a hardware malfunction, or a bug in the database software or the operating system, that causes the loss of the content of volatile storage, and brings transaction processing to a halt. The content of nonvolatile storage remains intact, and is not corrupted.

721

Chapter 16 Recovery System

The assumption that hardware errors and bugs in the software bring the database to a halt, and that the content of volatile storage is lost, is not always true.
